GridMind Live Paper Test

Daily Report: Delivery Day Saturday, October 31, 2026

Day 6 of 15 | Written October 30, 2026 at 2:31 PM | Ledger intact

Public version: the ENTSO-E day-ahead prices are left out because their license does not allow redistribution.

1. Summary of the Day

On Saturday, October 31, 2026, the best result came from doing nothing, which earned €0.00. That is about 0% of what a trader with perfect foresight could have made (€170.91), so roughly 100% of the possible profit was left on the table. However, the MILP agent that plans on yesterday's prices ended the day with a loss, which shows that a poor forecast can actually cost money rather than just reduce the gain. Looking at the whole test so far, the MILP agent that plans on yesterday's prices is in the lead with €1,732.52 in total, or €288.75 per day on average.

Table 1. Profit by agent in EUR on October 31, 2026 and since the test began on October 26, 2026

Agent	Day	Total	Per day	% of bound	Days	Losses
Perfect foresight (bound)	170.91	3,009.11	501.52	100.0	6	0
Do nothing	0.00	0.00	0.00	0.0	6	0
MILP, yesterday's prices	-23.11	1,732.52	288.75	57.6	6	1

2. Status of the Test

The hash chain of the ledger is intact (78 entries), which means that none of the earlier entries has been changed since it was written. The schedules for November 1, 2026 have not been fixed yet; they are due before noon (Warsaw time) on October 31, 2026. 8 agents are still waiting for enough price history. The test deliberately starts from fresh prices, so the forecasts that need a full week of data (the 7-day average and LEAR, which the PPO agents and the threshold rule also rely on) can only join once seven live days have been published. This was day 6 of the planned 15-day test. There are 9 days to go.

3. Figures

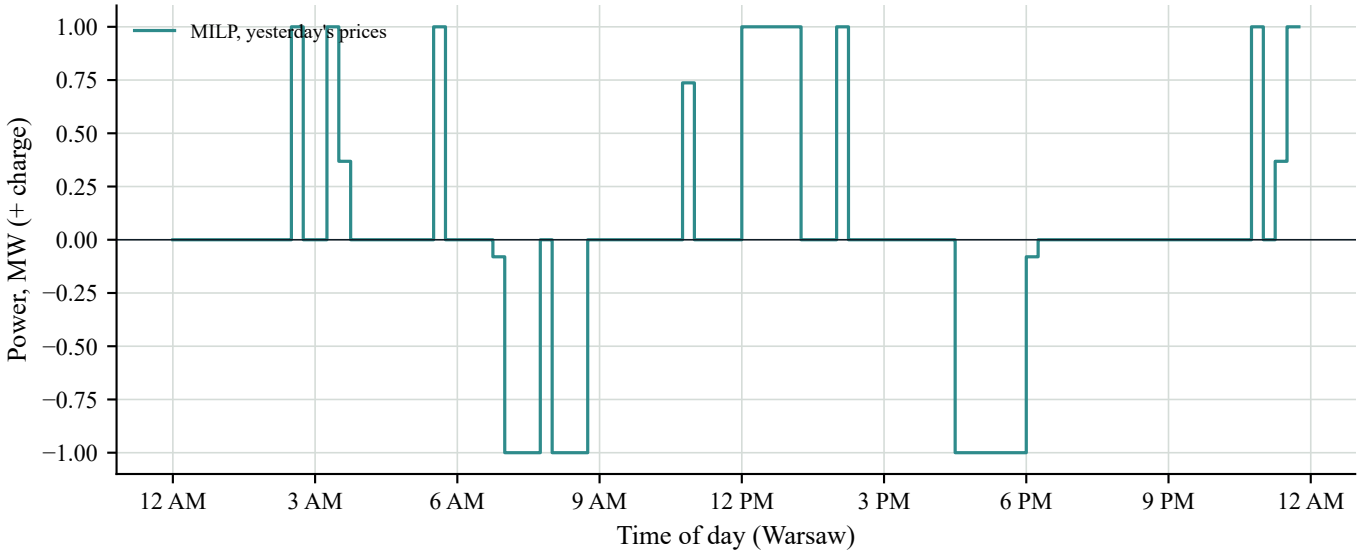

Figure 1. Schedule of 1 agent, fixed before the gate for October 31, 2026

Source: own study based on ENTSO-E Transparency Platform 12.1.D

Note: This is a paper-trading test. Each schedule is locked in before the noon deadline on the previous day and then scored against the published day-ahead prices; no order is ever sent to the market. Profits already include a wear cost of €10 per MWh charged or discharged, and the battery is rated at 1 MW / 2 MWh.
